PTA obligation discontinuity design

Documentation

General preprocessing pipeline

Cluster Standardize Identify **Extract** Identify obligations article names Step: substantive obligations from (within chapter) mandatory across different clauses clause clauses into intelligible PTAs categories distilbert supervised text bertopic topic classification > distilbert supervised text distilbert supervised text spaCy custom NER model classification flan-t5-base text2text topic classification classification (after manual wrangling) generation Script standardizeChapters infer.py isSubstantive infer.py rOb infer.py isMandatory infer.py modelTopics.py (for inference): Script rOb train.pv standardizeChapters train.py isSubstantive train.py isMandatory train.py (cannot just run python script, based on pre-trained (for training): has some command line steps, specified in Google flan-t5-base; the .py file) you can fine-tune to make better manual How to do more More involved: labels chapter reassignment.csv isSubstantive traindata.csv isMandatory train.csv label in label-studio, output ison as labeling? chapter dict.csv input to rOb train.py this step is new because what we previously did was cluster negotiator-

> assigned article titles and manually reclassified

Analysis pipeline

Script: variablePrep.py R hdfe.R

analyze_exportdf.csv

is the input file you can immediately put into R fixest

Where are files?

- Scripts are in scripts_new
- Base excel/csv files which can be used for training or as temporary vessels between each inference step are in other_source
- Transformer models which can be used for preprocessing inferences are in trfModels
- Note that the latter two have to be downloaded separately because they are lage files
